

Goal: Experiment with Color Palettes

1. Gmail Web Application

<https://mail.google.com/mail/>

2. Opened <http://color.adobe.com>

Then learned this tool about how to create color wheel and Accessibility check process.

3. After inspecting the Gmail Application, I found base color from CSS style then identified and labeled those color as per my understanding.

The color labels are given below:

Primary $\Rightarrow$ #0B57D0 (Brightest blue)

Secondary $\Rightarrow$ #001D35 (Darker blue)

Tertiary $\Rightarrow$ #041E49 (Even darker blue)

Neutral/Background $\Rightarrow$ #F2F6FC (Very light gray-blue, ideal for background or readable interface).

Neutral/Text Overlay $\Rightarrow$ #FFFFFF (Pure white, perfect for text)

Neutral/Gray variants $\Rightarrow$ #5F6368, #44476, #5E5E5E, #1F1F1F, #202124 (Varies range of grays for text, borders, or inactive states, providing hierarchy and neutrality).

4. This palette is best classified as a Monochromatic with neutral extensions scheme. The core colors (#0057D0, #001D35, #041E49) are variations of a single blue hue, adjusted for brightness and saturation, which defines a monochromatic base. The addition of neutral grays (#5F6368, #444746, #5E5E5E, #1F1F1F, #202124) and white (#FFFFFF) extends this into a practical UI palette.

5. During accessibility checking from adobe, I found some problem with color blind people. After taking those as consideration, I adjusted the similitan nearest color as single one based on adobe suggestions which reduced the number of color in the palette. After several steps, I checked again the accessibility for color blind and normal then found there is no concern from adobe tools. Details work files are attached also in the drive.
