Assignment 3 is posted

Understanding prototype fidelity

What is Digital Prototyping?

Introduction to various digital prototyping tools

# Reminder: What is a prototype?

---

A prototype is an incomplete, early version of a product

There are many approaches to building prototypes for software user interfaces

UI prototypes can be as simple as a drawing on a piece of paper or as complex as functional web application

- Or anywhere in between those extremes!

# Lo-Fi vs. Hi-Fi

---

Traditionally, prototypes are categorized as either lo-fi (low fidelity) or hi-fi (high fidelity)

Fidelity can be thought of as how close of an approximation of the final product is being attempted

In this class, we will often use lo-fi as a synonym for paper prototyping and hi-fi as a synonym for digital prototyping

Your design process should use *multiple* levels of fidelity as you move from an idea to a fully designed product

# Dimensions of Fidelity

[http://www.sapdesignguild.org/editions/edition7/proto\\_design.asp](http://www.sapdesignguild.org/editions/edition7/proto_design.asp)

A screenshot of the 'Plan an Edition' form in the SAP Design Guild. The form is titled 'Plan an Edition' and has a subtitle 'Working with Technology focuses on teacher's use of technology'. It includes a note: 'Please fill out all fields. For help with a field click on the ? or view the complete Help section.' The form fields include: 'Edition Title', 'Summary', 'Author' (filled with 'Archer Lake'), 'School', 'Grade taught' (filled with 'L1A L1Pro-4C L1K2 L1D-1 L1G-1 L19-12 L1Dthms'), 'Primary Subject' (filled with 'Science & Technology'), 'Curriculum Topic(s)', and 'Edition Description'. There is a 'Time Frame' field with a hint '(e.g., 8 weeks, 8 weeks, etc.)'. Below the form is a section titled 'NIST-T Standards Addressed' with a grid of checkboxes for various standards. A note at the bottom states: 'Note: Be sure to address all standards between Capstone slides 1 & 2. Green highlighted standards indicate selection in your other Capstone plans.' At the bottom are 'Save', 'Preview', and 'Clear' buttons, and a 'Refresh' link.

Fidelity can be broken down into four basic dimensions:

- Breadth
- Depth
- Look
- Interaction

# Breadth

---

The “breadth” of a prototype refers to how much of the product’s functionality is represented in the prototype

- A very narrow prototype only represents a single feature
- A broad prototype represents all intended functionality
- Prototypes should generally be as broad as needed to cover basic or most important tasks, but not much more

# Depth

---

The “depth” of a prototype refers to how much of the prototype is functional, and how robust it is

- A very shallow prototype has no backend at all and is hard-coded to respond as though the user had provided ideal input
- A deep prototype has some logic and error-handling capabilities
- At first glance, depth may seem unimportant, but it affects the amount of **exploration** a user can do
- Thus depth can actually have a *profound* influence on user testing!

# Look

---

“Look” is probably what most people think of when they think of prototype fidelity

It refers to how accurately a prototype represents the product’s intended appearance, including fonts, colors, and graphics

It’s generally a good idea to hold off on something that has a high fidelity look until later in the design process

- People are less likely to point out flaws and mistakes
- People can easily fixate on the “little” things
- You are less likely to throw it out and start again

# Interaction

---

“Interaction” refers to how the prototype handles input and output

Interaction can often be simulated

For example, you might create a digital prototype for an iPad application which runs on your desktop and responds to traditional a traditional mouse and keyboard

You might use hyperlinks or animation to simulate clicking interaction (e.g., in Powerpoint)

# Hi-Fi Prototyping

---

Once you have developed a lo-fi prototype and solicited feedback on it through peer critique and user testing:

- You may wish to create another lo-fi prototype
  - (isn't iterative design fun?)
- Or you may be ready to move on to a hi-fi prototype

Remember, a high fidelity prototype is a substantial time investment!

It is good for evaluating a working design that has been derived from a few rounds paper prototyping

# Things you will need to consider...

---

Choice of tool (more in a minute)

Typography / font

Color palette

Device

Interaction

Implementation

Start by creating a digital version of your paper prototype

Then iterate through user testing and feedback

*Don't design a beautiful prototype that can't be implemented!*

# Digital Prototyping Tools

---

There are literally hundreds...

And more released every day.

*I don't know them all!*

What you choose will depend on a variety of factors...

# Choosing a tool: Considerations

---

- **Learning Curve**
  - How long will it take me to learn this tool?
- **Usage**
  - Which device will it be used on?
- **Fidelity**
  - Will it showcase layout structure or complex interactions?
- **Sharing**
  - Can I collaborate with others on the prototype?
- **Cost**
  - How much am I prepared to pay for this tool?

# Comparing prototyping tools

A cool tool to help you do this: <http://www.prototypr.io/prototyping-tools/>

# Powerpoint or Keynote

All platforms  
Costs money ... but many  
of you have it already

# Sketch

Only for Mac

Costs money (\$99)

Student discount (\$49?)

# Figma

All platforms  
3 projects free

# Proto.io

All platforms

Free trial (15 days)

Then monthly fee

# InVision

All platforms

One project free, then  
monthly subscription
